NLP

1. n-gram
2. word2vec
    1. why not just use SVD? because SVD is much more computationally expensive compared to word2vec.
3. Applying embeddings
    1. Approach 1: learn these embeddings as parameters from your data
        1. often works pretty well.
    2. Approach 2: initialize word embeddings using GloVe, keep fixed
        1. faster because no need to update these parameters.
        2. Problem with antonyms.
    3. Approach3: Initialize word embeddings GloVe, fine-tune
        1. works best for some tasks
        2. standard in sentiment analysis
    4. Can also evaluate embeddings intrinsically on tasks like word similarity.
        1. Deep averaging Network
